

Protocols:

TCP stands for Transmission Control Protocol, TCP works as a connection protocol, it establishes connections and is very reliable, used for web browsing, and file shares.

UDP stands for User Datagram Protocol, UDP works as a connectionless protocol, it establishes connections without any connection beforehand, the user is sending data straight to the connected IP. This is used for like video streaming, movie streaming.

SNMP stands for Simple Network Management Protocol, SNMP is application based, so its used for monitoring network systems and devices.

IP stands for Internet Protocol, IP is unique to every network, as its what routes the packets in the network, its responsible for the communication over the internet. That means IP is used for data sharing or just anything that involves the internet.

SSL stands for Secure Sockets Layer, SSL is to secure networks during data delivery, involving encryption. SSL is used for many websites, establishing a secure connection and encrypts any information typed on the website, maintaining data security.
