

Basic OS install

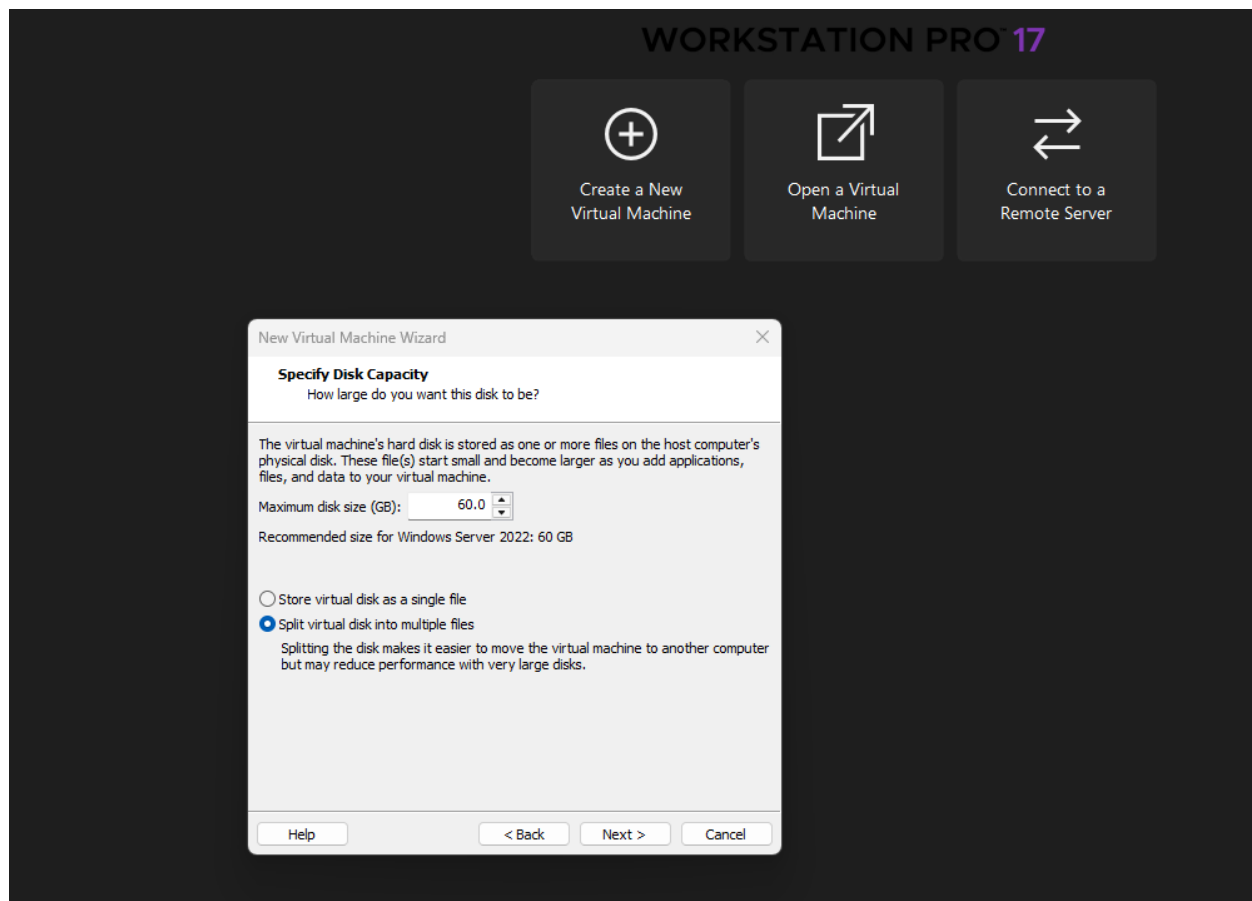

Collin King

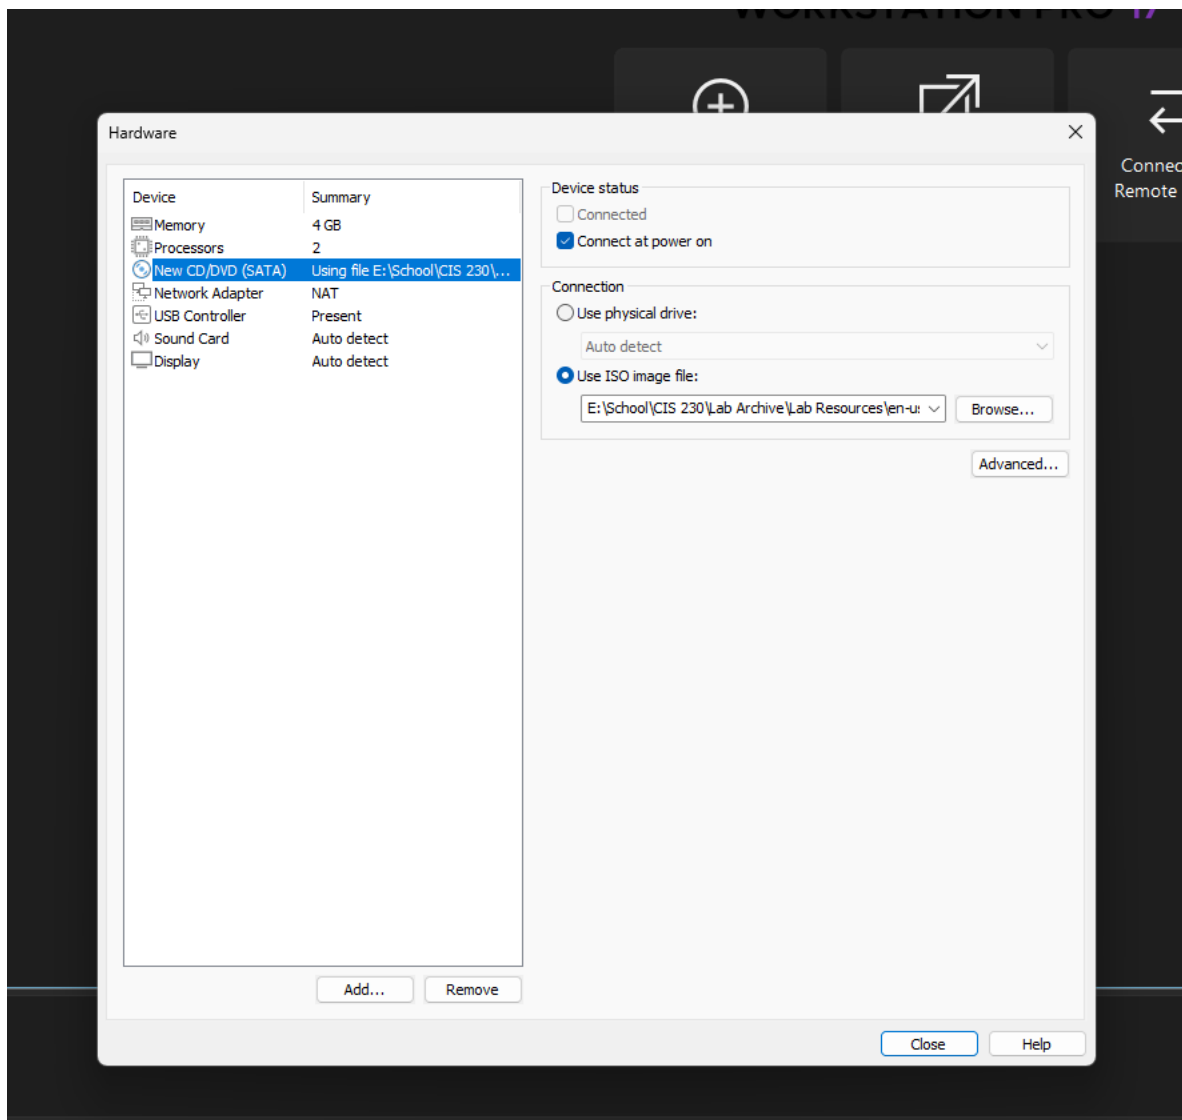

First, we must open VMWare, create a new virtual machine, and select the typical installation.

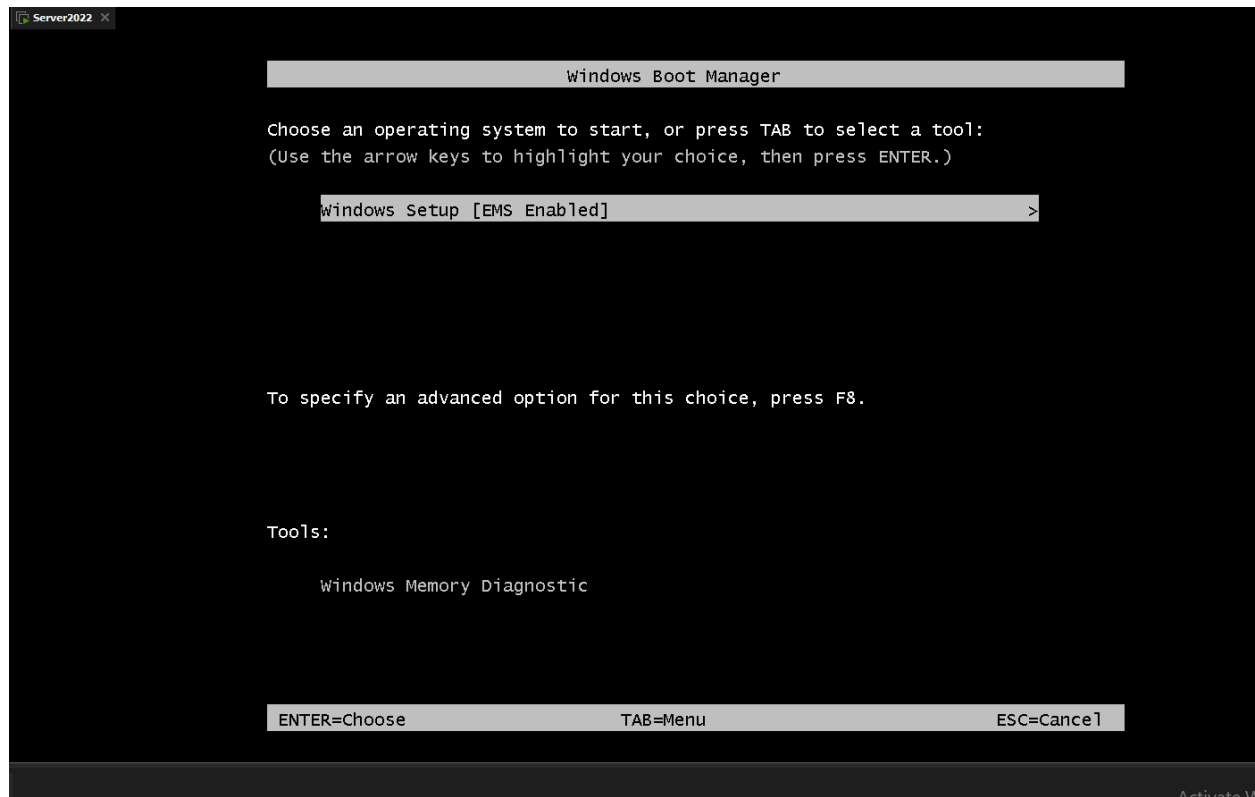

I selected 'I will install the operating system later' then selected Microsoft Windows as the guest OS, Windows Server 2022 as the version.

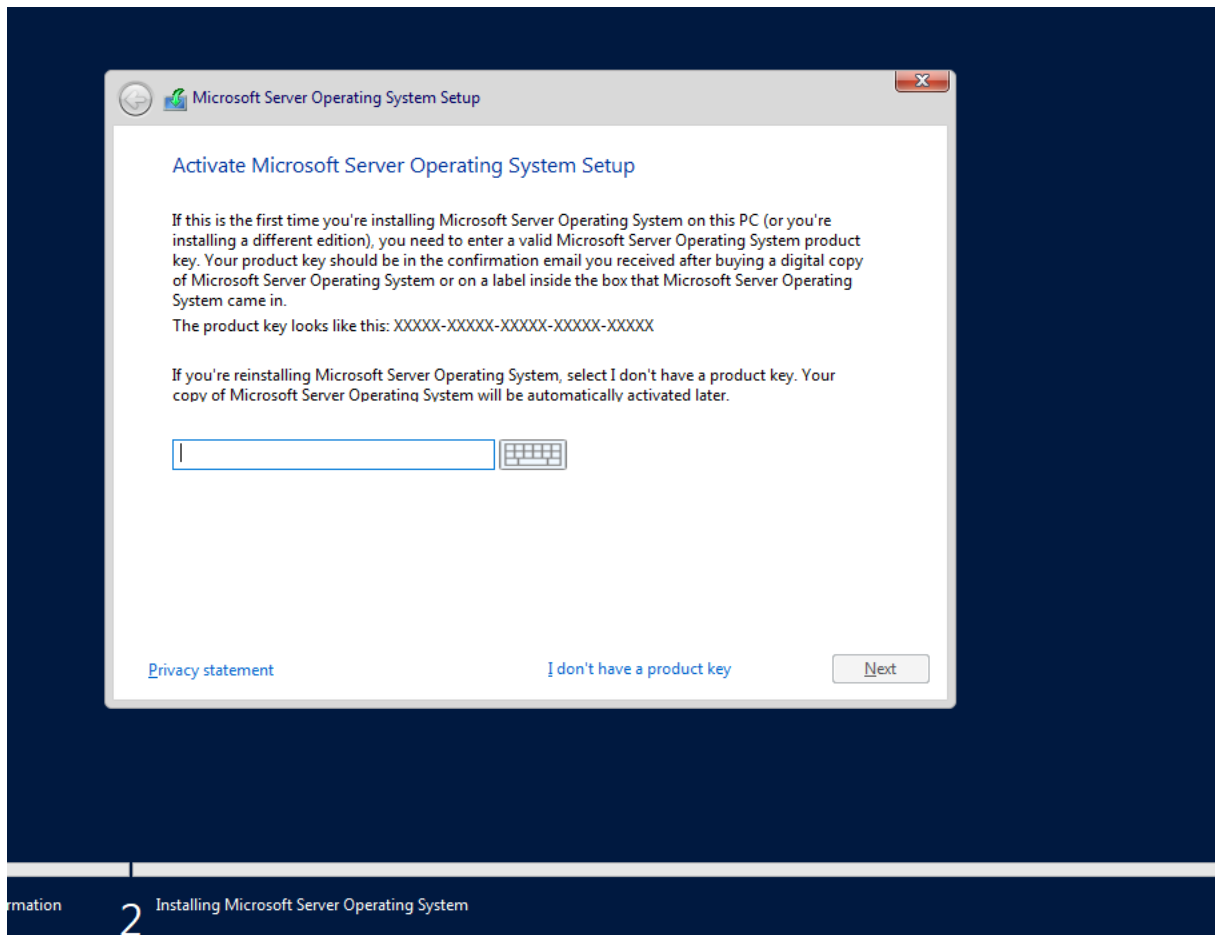

I left the default values for storage and made sure 'Split virtual disk into multiple files' was selected.

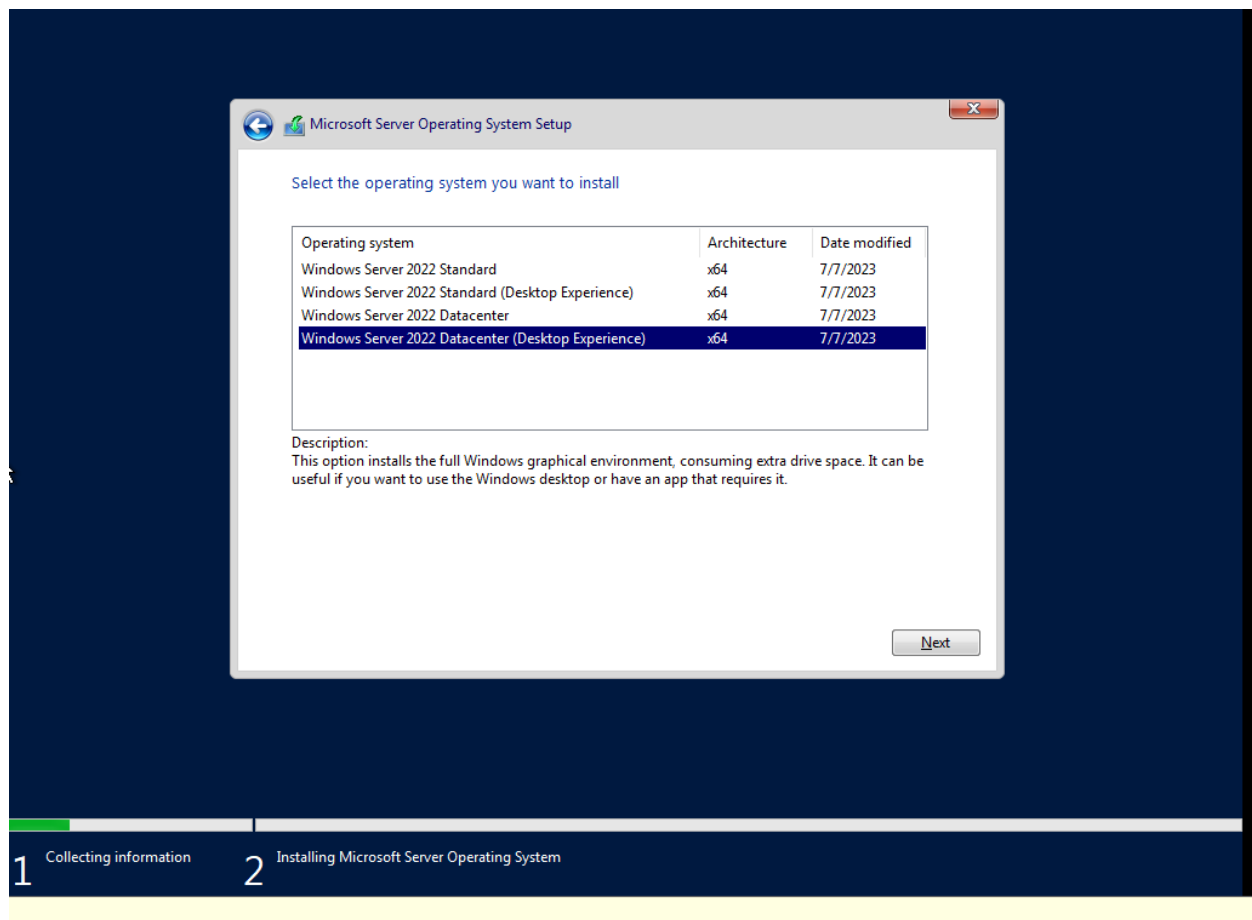

This is the hardware settings for the VM. I selected the .ISO file in the CD/DVD settings for the operating system. I made sure the installation was not on a OneDrive directory, and I upped the RAM usage to 4 GB.

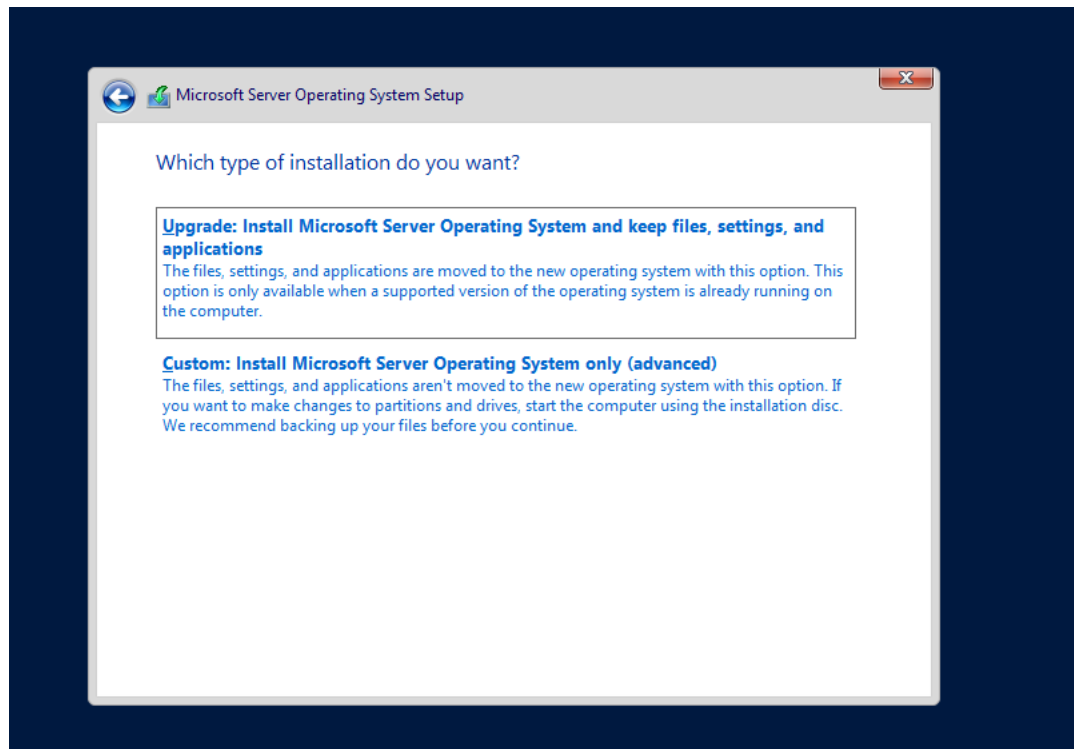

I powered on the VM then booted the Windows setup.

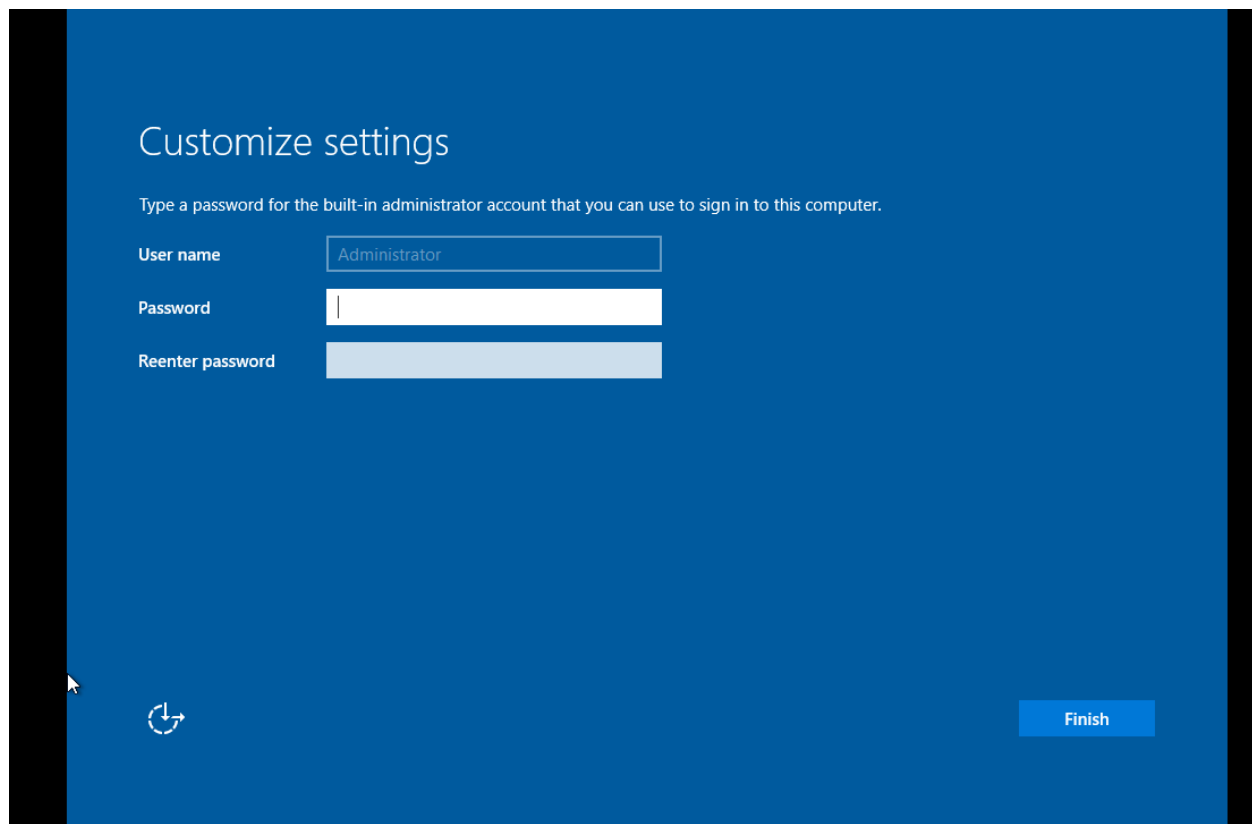

I selected the language, clicked install now, and then I clicked 'I don't have a product key' at the bottom.

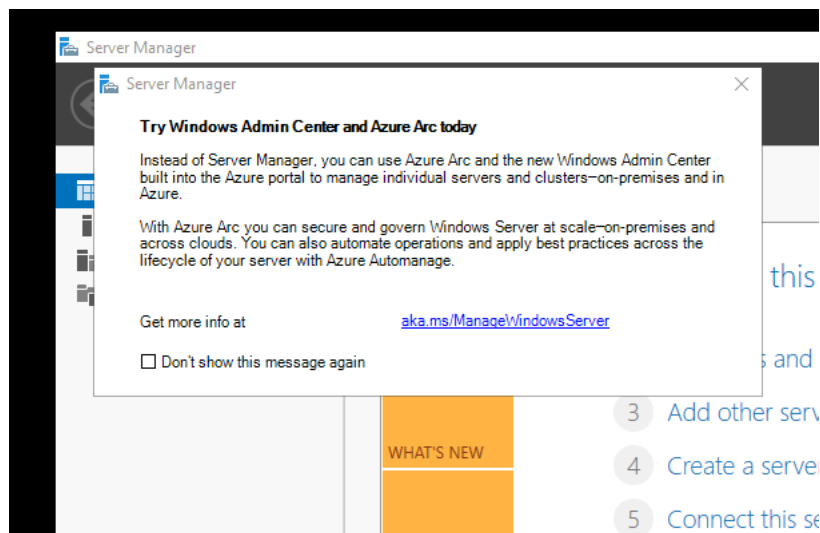

I then selected 'Windows Server 2022 Datacenter (Desktop Experience)'.

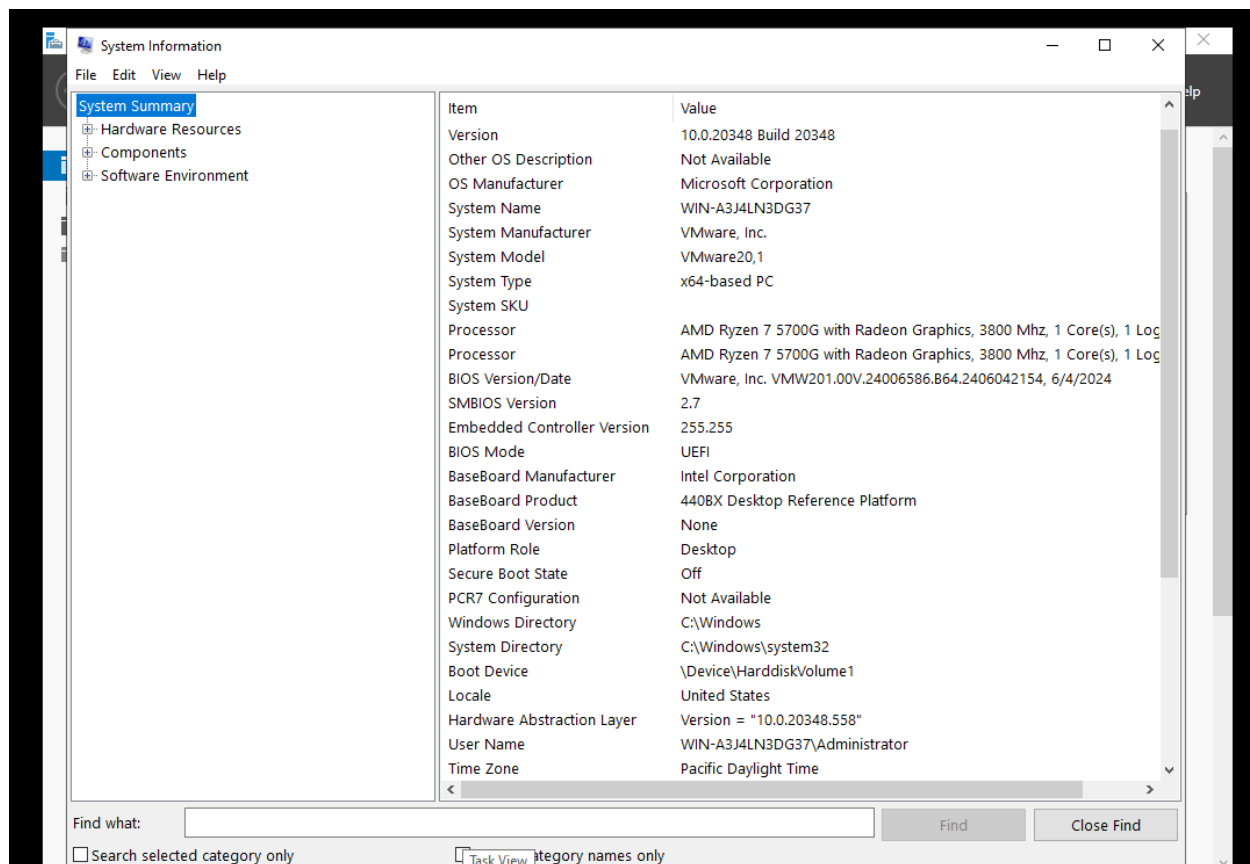

I selected Custom install, selected the storage device and clicked next.

I then applied a password for the Administrator account for the VM. Then booted the system up.

When booted up, the server manager should pop up, click 'don't show this message again.'

This is the Windows Server 2022 Virtual Machine system information.
