Install the latest PowerShell for new features and improvements! https://aka.ms/PSWindows

PS C:\Users\Administrator> ipconfig

Windows IP Configuration

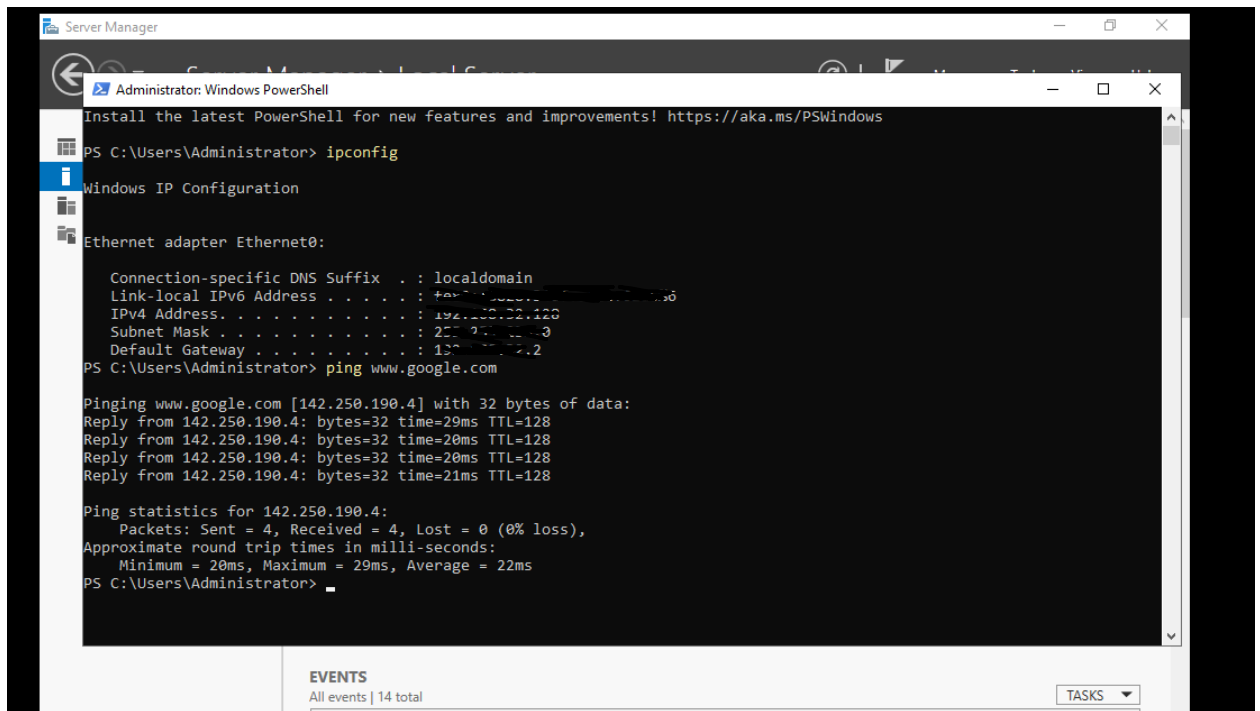

Ethernet adapter Ethernet0:

    Connection-specific DNS Suffix  . : localdomain
    Link-local IPv6 Address . . . . . : fe80::8828:34df:af2c:62a6%6
    IPv4 Address. . . . . : 192.168.1.100
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.1.1

PS C:\Users\Administrator>
```

The screenshot shows a Windows PowerShell window running as Administrator. The title bar reads "Administrator: Windows PowerShell". The window contains the standard PowerShell header, a message to install the latest PowerShell, and the output of the `ipconfig` command. The output shows the configuration for the Ethernet adapter Ethernet0, including the DNS suffix (localdomain), Link-local IPv6 address (fe80::8828:34df:af2c:62a6%6), IPv4 address (192.168.1.100), Subnet Mask (255.255.255.0), and Default Gateway (192.168.1.1). The prompt is currently at `PS C:\Users\Administrator>`. At the bottom of the window, there is an "EVENTS" pane showing "All events | 14 total" and a "TASKS" dropdown menu.

After checking the ethernet status in the properties, I ran PowerShell as admin then ran `ipconfig` to find my IPv4 and default gateway.

The screenshot shows a Windows PowerShell window titled "Administrator: Windows PowerShell" running within the Server Manager interface. The command prompt shows the execution of `ipconfig` and `ping www.google.com`. The `ipconfig` output displays the network configuration for Ethernet adapter Ethernet0, including the IPv4 address 192.168.12.128. The `ping` command successfully reaches the IP address 142.250.190.4, showing four successful replies with round-trip times between 20ms and 29ms.

```
PS C:\Users\Administrator> ipconfig

Windows IP Configuration

Ethernet adapter Ethernet0:

    Connection-specific DNS Suffix  . : localdomain
    Link-local IPv6 Address . . . . . : fe80::...
    IPv4 Address. . . . . : 192.168.12.128
    Subnet Mask . . . . . : 255.255.255.0
    Default Gateway . . . . . : 192.168.12.1

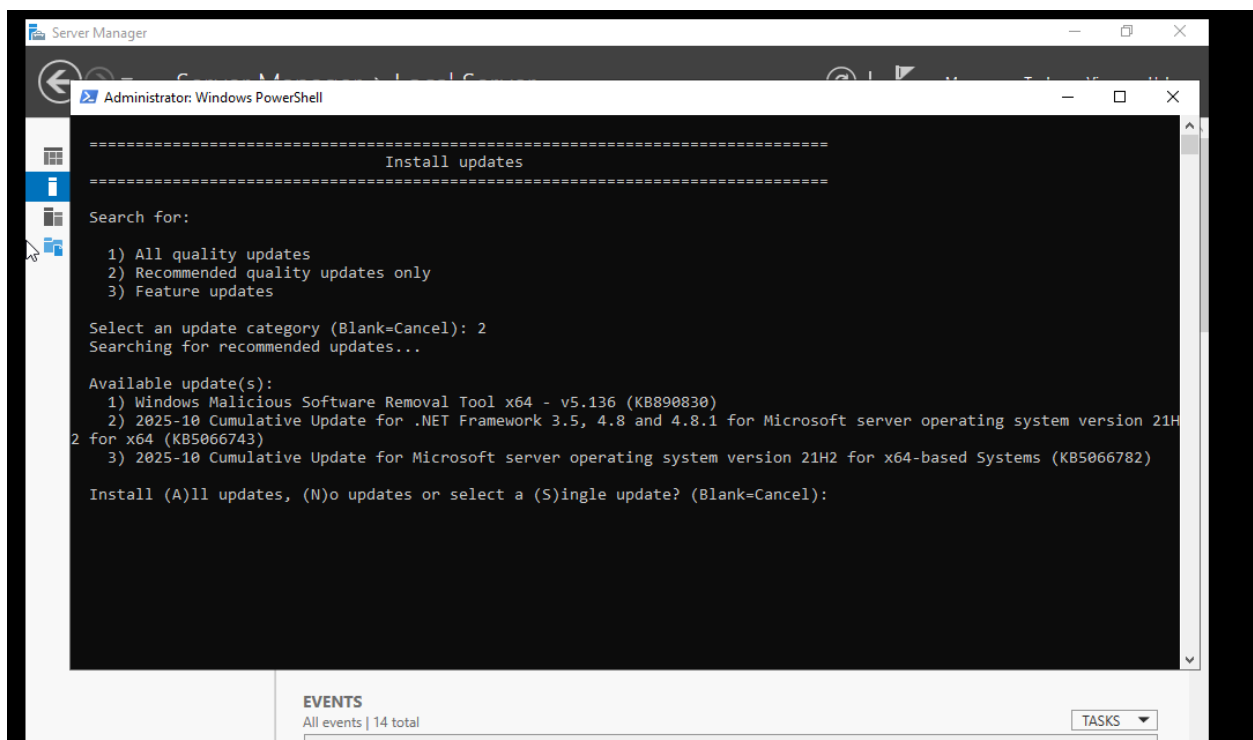

PS C:\Users\Administrator> ping www.google.com

Pinging www.google.com [142.250.190.4] with 32 bytes of data:
Reply from 142.250.190.4: bytes=32 time=29ms TTL=128
Reply from 142.250.190.4: bytes=32 time=20ms TTL=128
Reply from 142.250.190.4: bytes=32 time=20ms TTL=128
Reply from 142.250.190.4: bytes=32 time=21ms TTL=128

Ping statistics for 142.250.190.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 20ms, Maximum = 29ms, Average = 22ms

PS C:\Users\Administrator>
```

I then started pinging google. Ping was successful.

The screenshot shows the same PowerShell window with the Windows Update process initiated. It displays the "Install updates" menu, where option 2 (Recommended quality updates only) is selected. The search for updates is in progress, and a list of available updates is shown, including the Windows Malicious Software Removal Tool and two cumulative updates for .NET Framework and the Microsoft server operating system.

```

Searching for recommended updates...

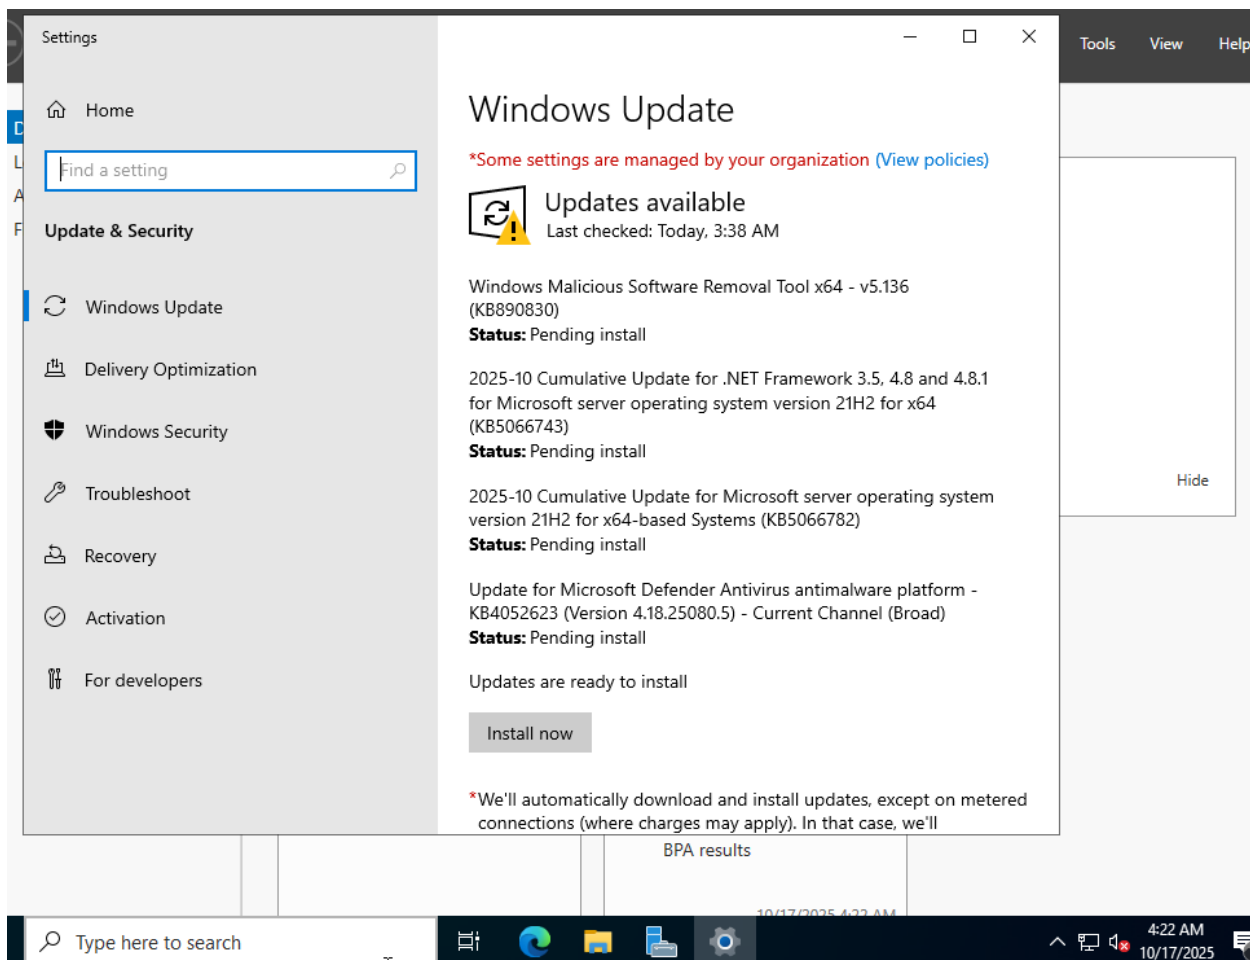

Available update(s):
1) Windows Malicious Software Removal Tool x64 - v5.136 (KB890830)
2) 2025-10 Cumulative Update for .NET Framework 3.5, 4.8 and 4.8.1 for Microsoft server operating system version 21H2 for x64 (KB5066743)
3) 2025-10 Cumulative Update for Microsoft server operating system version 21H2 for x64-based Systems (KB5066782)

Install (A)ll updates, (N)o updates or select a (S)ingle update? (Blank=Cancel):
```

I ran `sconfig` in PowerShell, typed 6 for the update's menu, then typed 2 for the quality updates.

After the update installation was complete I type Y to restart the system.

I logged back into the system then went to Windows update in settings. After I ran check for updates these came up, I installed the updates then powered down the system after the updates were completed.
